The GEX Playbook

Your Step-by-Step Guide to Reading the Market's Hidden Structure

NotebookLM

Trading in the Fog?

The market often feels like a random, unpredictable battlefield.

Without a map, traders are left guessing, reacting to noise, and fighting against uncertainty.
This leads to emotional decisions, not strategic strategic ones.

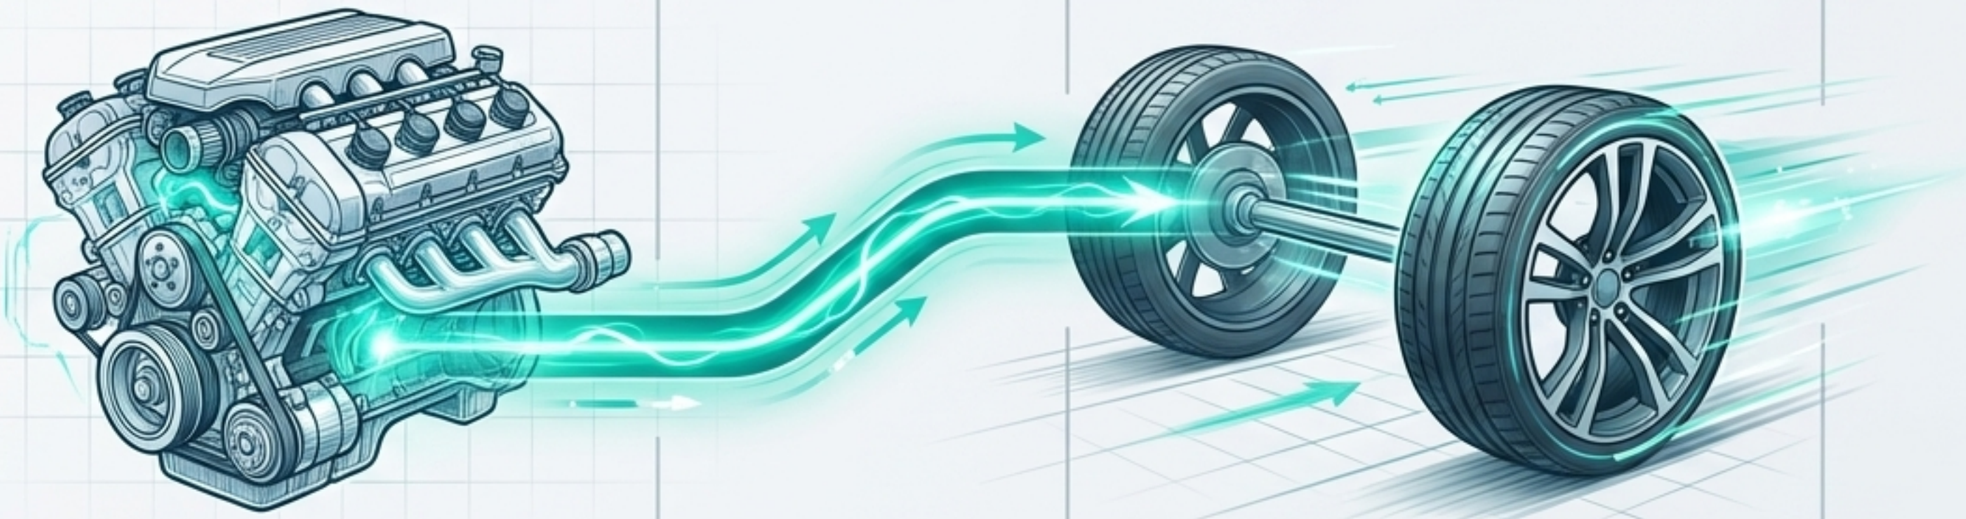

What if you could see the hidden structure that drives the price?

The Market Has an Engine Room. Here's the Key.

Introducing the **GEX Framework** – a methodology for anticipating market structure and behavior by analyzing Gamma Exposure **(GEX)** from the options market.

The ENGINE ROOM

Options Market (SPX/NDX)

Force is generated here. We use this institutional data to see the true market structure.

The WHEELS

Futures Market (ES/NQ)

This is what you drive. The primary driver of order flow in the futures market.

Decoding the Two Market Regimes

GEX+ Environment (THE GRAVITY ZONE)

- Dealers are long gamma
- Market tends to mean-revert
- Low volatility
- Range-bound behavior

Main Strategy: Use Max. GEX+ as a magnet. Trade pullbacks towards the level or fades at these levels.

GEX- Environment (THE ACCELERATION ZONE)

- Dealers are short gamma
- Market is prone to breakouts
- High volatility
- Directional moves

Main Strategy: Use Max. GEX- as a magnet level for the target. If broken, use it as an acceleration zone. Trade momentum and continuations.

NotebookLM

Know Your Battlefield: The 3 Key GEX Levels

Level 1: Max GEX+ (The Wall)

Description: Acts like a powerful magnet, pulling price towards it and often causing reversals. The peak of the "Gravity Zone."

Level 2: Zero Gamma (The Pivot)

Description: The critical line in the sand. Crossing this level signals a potential shift in the market regime from gravity to acceleration, or vice-versa.

Level 3: Max GEX- (The Void)

Description: A level where price can accelerate dramatically. It acts as a target in a downtrend and a potential launchpad if broken.

The 4 High-Probability Plays

Now we combine our understanding of the Regimes and Levels into actionable trading scenarios. These four plays are based on price position relative to Zero Gamma and the GEX+/- levels.

From Zero Gamma to Max. GEX+

From Zero Gamma to Max. GEX-

Price at Max. GEX+

Price at Max. GEX-

Each of these primary scenarios carries a **70-80% success rate** when the correct entry type is applied.

NotebookLM

The GEX Playbook

Play #1: From Zero Gamma to GEX+ (The Gravity Pull)

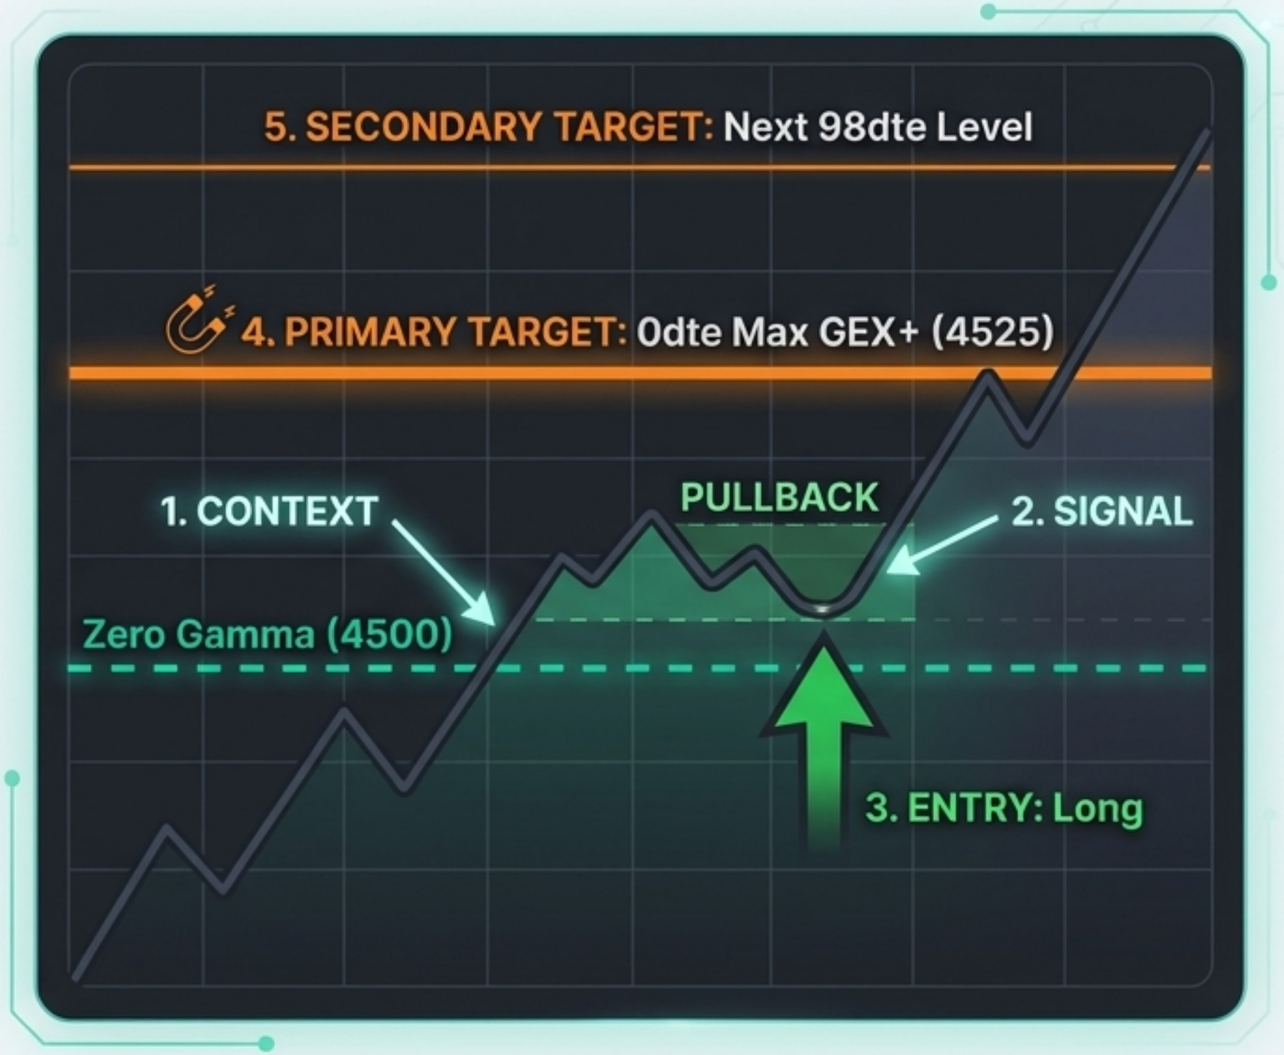

Scenario: Price crosses into the "gravity zone" and is being attracted towards the Max. GEX+ "magnet".

Success Rate: 70-80%

Best Entry Type: **Pullback**

Example Walkthrough:

1. **Context:** ES crosses Zero Gamma at 4500. Max. GEX+ is at 4525.
2. **Action:** Wait for a pullback to 4505-4508 to enter long.
3. **Targets:**
   - **Primary Target:** The 0dte Max GEX+ level.
   - **Secondary Target:** The next 98dte gamma level.

Retail TraderPro
NotebookLM

Play #2: From Zero Gamma to GEX- (The Acceleration)

Scenario: Price falls into the "acceleration zone" with no gamma brakes to stop the move.

Success Rate: 70-80%

Best Entry Type: Pullback (Sell the Rip)

Example Walkthrough:

1. **Context:** NQ breaks below Zero Gamma at 15000. Max. GEX- is at 14800.
2. **Action:** Wait for a slight rejection in the Zero Gamma zone (e.g., 14990-14995) to confirm weakness and enter short.
3. **Targets:**
    - **Primary Target:** The next 0dte Max. GEX- level.
    - **Secondary Target:** The next 98dte GEX level.

NotebookLM

The GEX Playbook

Play #3: Price at Max GEX+ (The Wall)

Scenario: Price arrives at the "wall" or "magnet" with maximum attraction and uncertainty, creating a high-probability reversal opportunity.

Reversal Rate: **70-80%**

Best Entry Type: Fade the Level

Example Walkthrough:

1. **Context:** ES touches Max. GEX+ at 4525.
2. **Action:** Look for a reversal signal (e.g., wick candle) to sell. Also, confirm with the presence of Stops, Icebergs, Sweeps, and absorption on the Orderflow/Bookmap.
3. **Targets:**
   - **Primary Target:** The Zero GEX level.
   - **Secondary Target:** The next 98dte GEX level.

The GEX Playbook

Play #4: Price at Max GEX- (The Void)

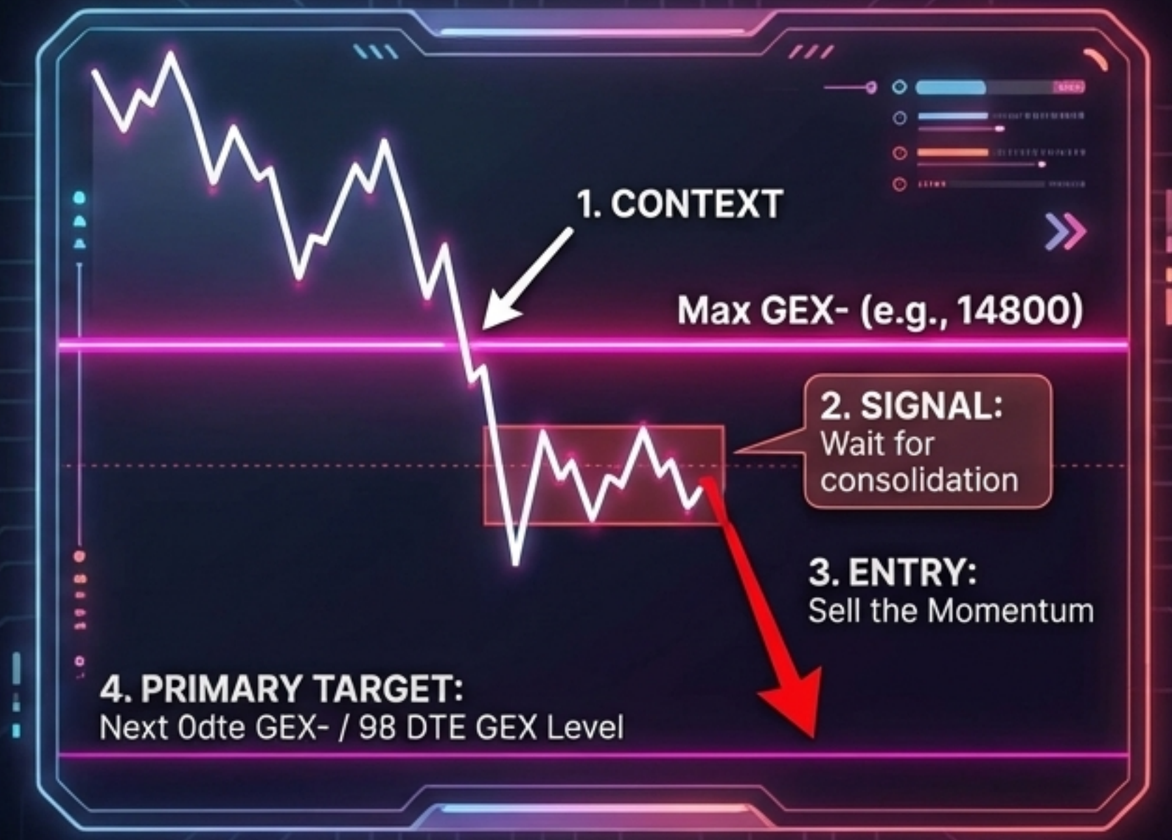

Scenario: Price is in the 'void' with maximum acceleration, causing impulsive movement. This is a trend-following play.

Continuation Rate: 70-80%

Best Entry Type: Momentum

Example Walkthrough:

1. **Context:** NQ is falling towards Max. GEX-. The level was broken.
2. **Action:** Wait for a small pullback consolidation to sell after the breakout.
3. **Targets: Primary Target:** The Max 0dte GEX- level or the next 98 DTE GEX level.

Mastering Your Entry: A Probabilistic Approach

HIGH PROBABILITY (70-80% Success Rate)

Annotation

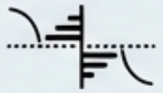

Minimisatt crads

Brief consolidation following

PULLBACK

Enter in the direction of the trend after a small pause or pullback.

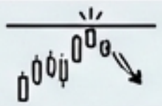

Ideal Scenario:
ZeroGEX → GEX+/-

FADE LEVEL

Trade against the move when the price touches the Max. GEX+ level.

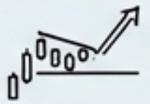

Ideal Scenario:
Price at Max. GEX+

MOMENTUM

Join the current trend after a brief consolidation following the breakout.

Ideal Scenario:
Price at Max. GEX-

LOW PROBABILITY (20-30% Success Rate)

Nennotation

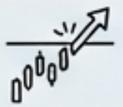

Price forceully the GEX+ level

Attemptng a reversal zone

BREAKOUT

Enter when the price forcefully breaks the GEX+ level.

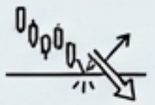

Ideal Scenario:
Price at Max. GEX+

REVERSAL

Trying to buy a dip or sell a rip in a GEX- zone.

Ideal Scenario:
Price at Max. GEX-

The Golden Rule of GEX Trading

“In GEX+ Regime, think like a contrarian.”

“In GEX- Regime, think like a trend follower.”

Retail TraderPro

The Pre-Flight Checklist: Trade with Discipline

Quick Checklist (Pre-Trade)

1. Identify price position vs. Zero Gamma.
2. Determine scenario (4 possible).
3. Identify next key gamma level.
4. Confirm with Orderflow/MBO data.
5. Apply entry based on probability.

Risk Management

- Risk per trade: 1% of capital
- Max daily risk: 3%
- Max simultaneous positions: 2
- 3 consecutive losses → stop for the day

Rules for NOT TRADING

- 30 min before macro data (CPI, FOMC, NFP)
- GEX is neutral or contradictory
- VIX rising > 5% intraday
- Orderflow shows no confirmation

NotebookLM

Level Up: Deepening Your Analysis with Vega & Skew

To gain a 3D view of the market, layer Volatility (Vega) and Skew on top of the GEX structure.

Vega (IV) - The Intensity Dial

High IV in a GEX+ environment signals a compressed spring and higher breakout risk. Low IV confirms a stable, predictable range.

Skew - The Directional Bias

Skew is the market's directional bias. A steep skew (expensive puts) indicates fear of a crash, increasing the risk of a downside breakout.

A flat skew indicates euphoria (FOMO), increasing the risk of an upside breakout.

The GEX Master Cheat Sheet

Situation	Dealer Gamma	Highest Probability Strategy	Primary / Secondary Target	Success Rate
Zero → Max. GEX+	Long gamma	Pullback entry (buy dips)	0dte GEX+ Level → Next 98dte GEX level	70-80%

Situation	Dealer Gamma	Highest Probability Strategy	Primary / Secondary Target	Success Rate
Zero → Max. GEX-	Short gamma	Pullback entry (sell rips)	0dte GEX- Level → Next 98dte GEX level	70-80%

Situation	Dealer Gamma	Highest Probability Strategy	Primary / Secondary Target	Success Rate
Price at Max. GEX+	Long gamma	Fade the level (reversal)	Zero Gamma Line → Next 98dte Gamma level	70-80%

Situation	Dealer Gamma	Highest Probability Strategy	Primary / Secondary Target	Success Rate
Price at Max. GEX-	Short gamma	Momentum (continuation)	Next 0dte GEX → Next 98 DTE Gamma	70-80%

Remember: The key is to adapt your mindset and entry type to the market's structure. The Zero Gamma line is a critical pivot, this is the line in the sand.
